

ABSTRACT

A device consisting of a common off the shelf paint brush , which having attached to it a platform with clamps or band of flexible material either of which holds a rigid tube on top of and parallel to the long axis of the brush, the same tube being connected on one end to a paint supply tube and on the other to an attached apron, the apron of which summarily allows the flow of paint from the rigid tube to be distributed onto the brush bristles over the entire upper bristle area, the apron also acting to prevent paint dripping from the central area of the brush, thusly, the paint being delivered to a surface via the brush bristles in the conventional manner all of which allows the painter to continuously apply paint without interruption.
